REVOLUTIONARY WATERPROOF, BREATHABLE, CUSTOMIZED 3D PRINTED CASTS ARRIVE IN CASTLE ROCK

ActivArmor™ launches a new clinic in Castle Rock, for its Patient Specific custom casts and splints

Castle Rock, CO, September 25, 2017– ActivArmor™, producer of the first commercially available waterproof, breathable and hygienic custom orthoses affordable enough to compete with traditional casting and splinting, is excited to announce its new partnership with HealthFit Family Medicine (www.HealthFitColorado.com), a leading provider of holistic patient care, in the Castle Rock area.

ActivArmor™ is the only FDA listed, custom 3D printed splint available in the United States. It empowers patients with the freedom to be able to maintain their active lifestyles. It provides a far superior alternative to traditional plaster casts or available splinting options, that is truly waterproof, breathable, hygienic, reusable, and precisely designed for each patient — and it's covered by most private insurance, Medicare, and Medicaid.

HealthFit™ Family Medicine provides comprehensive, integrated medicine to the Castle Rock market, and beyond. Their family care physicians don't just manage chronic medical conditions, they work to cure diseases and acute medical conditions.

"We are excited to be expanding nation-wide this year after over 2 years of field tests," said ActivArmor Founder, Diana Hall. "Every medical provider now has the ability to provide their patients with the latest high-tech immobilization option by simply writing a prescription for ActivArmor."

This new partnership between ActivArmor™ and HealthFit™ provides the Castle Rock and south Denver community with a revolutionary new way to treat injuries to the forearm, wrist, and hand. Since ActivArmor devices are custom designed for each patient's unique body shape, and injury or condition, referring physicians have the ability to expose pins, incisions or lacerations for visualization and treatment, and adaptability with advanced technologies like bone and muscle stimulators and biomonitors. Patients are now empowered to maintain their active lifestyle, while they heal. They have benefits for kids, athletes, and anyone that wishes to stay active during their recovery period.
